Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

## Application No. Applicant(s) 10/761.625 PAN ET AL. Office Action Summary Examiner Art Unit TUAN H. NGUYEN 2618 -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --Period for Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS. WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status 1) Responsive to communication(s) filed on 18 January 2008. 2a) ☐ This action is FINAL. 2b) This action is non-final. 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213. Disposition of Claims 4) Claim(s) 1.2.5-9 and 12-17 is/are pending in the application. 4a) Of the above claim(s) 3.4.10, and 11 is/are withdrawn from consideration. 5) Claim(s) \_\_\_\_\_ is/are allowed. 6) Claim(s) 1,2,5-9 and 12-17 is/are rejected. 7) Claim(s) \_\_\_\_\_ is/are objected to. 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement. Application Papers 9) The specification is objected to by the Examiner. 10) The drawing(s) filed on is/are; a) accepted or b) objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abevance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152. Priority under 35 U.S.C. § 119 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) All b) Some \* c) None of: Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). \* See the attached detailed Office action for a list of the certified copies not received.

### DETAILED ACTION

## Response to Arguments

Applicant's arguments, see applicant's remarks, filed on 01/18/2008, with respect
to the rejection(s) of claims 1-2, 5-9, and 12-17 under 35 U.S.C § 103(a) have been fully
considered and are persuasive. Therefore, the rejection has been withdrawn.
 However, upon further consideration, a new ground(s) of rejection is made in view of
Pehlke et al. (US PUB. 2002/0136325 hereinafter, "Pehlke"), Hareyama (U.S PAT.
6,700,440) and Gandhi et al. (US PAT. 6,968,201 hereinafter, "Gandhi").

# Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-2, 5, 8-9, and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pehlke et al. (US PUB. 2002/0136325 hereinafter, "Pehlke") in view of Hareyama (U.S PAT. 6,700,440) and further in view of Gandhi et al. (US PAT. 6,968,201 hereinafter, "Gandhi").

Art Unit: 2618

Consider claims 1 and 8, Pehlke teaches receiving an instruction to adjust the output power of power amplifier (fig. 4 page 5 [0051]); and amplifying a signal according to the adjusted output power (fig. 4 page 5 [0051]).

Pehlke does not explicitly show that powering on or off at least one branch of the power amplifier according to the received instruction to enable a logarithmic change in output power of the amplifier.

In the same field of endeavor, Hareyama teaches powering on or off at least one branch of the power amplifier according to the received instruction to enable a logarithmic change in output power of the amplifier (col. 5 lines 29-38 and col. 6 lines 28-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use, powering on or off at least one branch of the power amplifier according to the received instruction to enable a logarithmic change in output power of the amplifier, as taught by Hareyama, in order to provide a high frequency power amplifier having further improved efficiency thereof in comparison with a conventional amplifier and having a structure such that its output can be controlled continuously by changes in the drain voltages of switching-driven transistors.

Pehlk and Hareyama in combination, fails to teach the instruction specifies at least one of a percentage change in power and a dB change in power.

However, Gandhi teaches the instruction specifies at least one of a percentage change in power and a dB change in power (col. 2 lines 26-49).

Art Unit: 2618

Therefore, it is obvious to one of ordinary skill in the art at the time the invention was made to incorporate the disclosing of Gandhi into view of Pehlk and Hareyama in order to generate power adjust commands for mobiles being served by a base station in a system-based, or centralized, manner by considering overall system performance during power control, rather than solely considering the state of individual mobiles, when high interference conditions occur.

Consider claim 2, Pehlke further teaches transmitting the amplified signal (page 6 [0064]).

Consider claims 5, Pehlke further teaches the powering on or off a branch of the power amplifier linearly in dB changes the output power of the amplifier (page 6 [0064]).

Consider claim 9, Pehlke teaches a receiving engine capable of receiving an instruction to adjust the output power of power amplifier (fig. 4 page 5 [0051]); and a power amplifier engine, communicatively coupled to the determining engine and the power amplifier, capable of transmitting the determination to the power amplifier (col. 6 lines 3-23).

Pehlke does not explicitly show that a determining engine, communicatively coupled to the receiving engine, capable of determining how many branches of a power amplifier to power on or off according to the received instruction to enable a logarithmic change in output power.

Application/Control Number: 10/761,625 Art Unit: 2618

In the same field of endeavor, Hareyama teaches a determining engine, communicatively coupled to the receiving engine, capable of determining how many branches of a power amplifier to power on or off according to the received instruction to enable a logarithmic change in output power (col. 5 lines 29-38 and col. 6 lines 28-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use, a determining engine, communicatively coupled to the receiving engine, capable of determining how many branches of a power amplifier to power on or off according to the received instruction to enable a logarithmic change in output power, as taught by Hareyama, in order to provide a high frequency power amplifier having further improved efficiency thereof in comparison with a conventional amplifier and having a structure such that its output can be controlled continuously by changes in the drain voltages of switching-driven transistors.

Pehlk and Hareyama in combination, fails to teach the instruction specifies at least one of a percentage change in power and a dB change in power.

However, Gandhi teaches the instruction specifies at least one of a percentage change in power and a dB change in power (col. 2 lines 26-49).

Therefore, it is obvious to one of ordinary skill in the art at the time the invention was made to incorporate the disclosing of Gandhi into view of Pehlk and Hareyama in order to generate power adjust commands for mobiles being served by a base station in a system-based, or centralized, manner by considering overall system performance during power control, rather than solely considering the state of individual mobiles, when high interference conditions occur.

Application/Control Number: 10/761,625 Art Unit: 2618

Consider claim 12, Pehike further teaches the powering on or off a branch of the power amplifier linearly in dB changes the output power of the amplifier (page 6 [0064]).

 Claims 15-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pehlke et al. (US PUB. 2002/0136325 hereinafter, "Pehlke") and further in view of Hareyama (U.S PAT. 6,700,440).

Consider claim 15, Pehlke teaches a power amplifier, comprising: a plurality of branches for controlling transistors (fig. 2B page 2 [0022]).

Pehlke does not explicitly show that a plurality of transistors, each transistor being communicatively coupled to a branch of the plurality of branches, wherein the transistors are arranged in a logarithmic scale, thereby enabling a logarithmic change in output power with the powering on or off of a transistor.

In the same field of endeavor, Hareyama teaches a plurality of transistors, each transistor being communicatively coupled to a branch of the plurality of branches, wherein the transistors are arranged in a logarithmic scale, thereby enabling a logarithmic change in output power with the powering on or off of a transistor (col. 5 lines 29-38 and col. 6 lines 28-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use, a plurality of transistors, each transistor being communicatively coupled to a branch of the plurality of branches, wherein the

Art Unit: 2618

transistors are arranged in a logarithmic scale, thereby enabling a logarithmic change in output power with the powering on or off of a transistor, as taught by Hareyama, in order to provide a high frequency power amplifier having further improved efficiency thereof in comparison with a conventional amplifier and having a structure such that its output can be controlled continuously by changes in the drain voltages of switching-driven transistors.

Consider claim 16, Pehike further teaches the powering on or off a branch of the power amplifier linearly in dB changes the output power of the amplifier (page 6 [0064]).

Consider claim 17, Pehlke further teaches a transmitter comprising a power amplifier (page 6 [0061]).

 Claims 6-7 and 13-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pehlke in view of Hareyama and Gandhi and further in view of Eidson et al. (U.S PAT. 6,255,906 hereinafter "Eidson").

Consider claims 6 and 13, Pehlk, Hareyama, and Gandhi in combination, fail to teach thermometer coded power control words are used to power on and off branches of the amplifier.

However, Eidson teaches thermometer coded power control words are used to power on and off branches of the amplifier (col. 5 lines 27-34).

Art Unit: 2618

Therefore, it is obvious to one of ordinary skill in the art at the time the invention was made to incorporate the disclosing of Eidson into view of Pehlk, Hareyama, and Gandhi in order to provide the power amplifier is operated as a completely digital device with a certain degree of digital pre-distortion compensation.

Consider claims 7 and 14, Eidson further teaches the thermometer coded power control words ensure monotonic power control (col. 5 lines 31-34).

#### Conclusion

6. Ar	ny response to	this action	should be	mailed to:
-------	----------------	-------------	-----------	------------

Mail Stop (Explanation, e.g., Amendment or After-final, etc.)
